

AI-Powered Customer Support & Service Automation Using Salesforce

Proposed Solution

Project Name	AI-Powered Customer Support & Service Automation Using Salesforce
--------------	---

Project Overview

Develop a Salesforce-based CRM application that automates customer support using AI, intelligent workflows, and centralized case management.

Objective

Reduce manual effort, improve response times, automate case routing, and generate AI-powered summaries to enhance customer satisfaction.

Scope

Covers customer registration, merchandise and order management, user case handling, validation rules, queues, record-triggered flows, Prompt Builder, Agentforce, reports, and dashboards.

Problem Statement

Traditional support processes rely heavily on manual case assignment and fragmented information, resulting in delayed responses, inconsistent service quality, and reduced operational efficiency.

Proposed Solution

Implement a Salesforce solution that combines custom objects, queues, record-triggered flows, Prompt Builder, Agentforce, validation rules, and dashboards to automate customer support from case creation to resolution.

Key Features

- AI-generated case summaries using Prompt Builder
- Automatic case routing using Queues and Flows
- Validation rules for business logic
- Customer, Order, Merchandise and User Case management
- Reports & Dashboards for performance monitoring

Resource Requirements

Platform: Salesforce Developer Edition
Development Tools: VS Code, Salesforce CLI, Git & GitHub
AI Components: Prompt Builder, Agentforce
Reporting: Salesforce Reports & Dashboards
